-1 - FUNCTION: RESPONSIBLE FOR PLASTICITY OF THE CELL WALL (POTENTIAL).

-1 - SUBCELLULAR LOCATION: Cell wall (Potential).

-1 - MISCELLANBOUS: THIS PROTEIN CONTAINS 67% GLYCINE RESIDUES.

-1 - MISCELLANBOUS: PROTEIN RESIDUES ARE CAPABLE OF FORMING A BETA-PLEATE SHEET COMPOSED OF 8 ANTI-PARALLEL STRANDS.

-1 - MISCELLANBOUS: THE GLYCINE REGION IS COMPRISED OF TWO RELATED FAMILIES OF REPEATS, F1 AND F2, EACH REPEAT CONTAINING ABOUT 40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SEQUENCE FROM N.A.

-I- FUNCTION: MAJOR STRUCTURAL PROTEIN OF TISSUES SUCH AS AORTA AND
NUCHAL LIGAMENT, WHICH MUST EXPAND RAPIDLY AND RECOVER COMPLETELY.

-I- SUBUNIT: THE POLYMERIC ELASTIN CHAINS ARE CROSS-LINKED TOGETHER
INTO AN EXTERNIBLE 3D EXPRONCE.

-I- SUBCELLULAR LOCATION: EXPRACELLULAR MATRIX OF ELASTIC FIBERS.

-I- PTW: THE CROSSLINKS ARE MADE OF DEAMINATED LYS.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                     2. The invention provides methods for purifying structural proteins. Organic acids are used to lyse recombinant cells or other biological samples (such as non-recombinantly derived cells), and enrich the purity and yields of structural proteins by hydrolysing many of the macromolecules while leaving proteins by hydrolysing many of the macromolecules while leaving perites of E. coll were lysed in 9.2 N valeric acid for 1 hr at room temperature. The cell lysate was clarified by centrifugation and applied to an SDS polyacrylamide gel for electrophoresis. The OmpF protein was then blotted onto a nitrocellulose membrane for N terminal sequencing. The simple extraction procedure yielded for the protein was then blotted onto a nitrocellulose membrane for N terminal sequencing. The simple extraction procedure yielded for the protein man approximately 85% purity. The new method has the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Bacteria; attenuation; deletion; mutant; vaccine; immune response; Gram negative; infection; diarrhoea; food poisoning; typhoid; salmonellosis; gonorrhoea; gastroenteritis; whooping cough.

C (AAZ22889-Z22893) to produce a non-reverting deletion mutation. The mutant compt gene (AAZ22889) was used in the production of a bactcrium cartenuated by a non-reverting mutation in each of the compt gene, the arcc gene (AAZ22885) AAZ22884), and the compt gene (AAZ22885, AAZ22886). The arcc gene (AAZ22885) AAZ22884), and the compt gene (AAZ22885) AAZ22886). The arcc gene (AAZ22885) AAZ22886), and the compt gene (AAZ22885). The arcc c gene (AAZ22885) AAZ22886). The arcc c gene (AAZ22885) AAZ22886). The arcc c gene (AAZ22885) and a non-reverting an immune response against a c variety of bacteria in a mammalian host. Such vaccines can provide protection against e.g., E. coli (a cause of diarrhoea in humans), a shunonella typhimurium (the cause of mannellosis in several animal species), S. typhi (the cause of human typhiod), S. enteritidis (a cause of salmonellosis of food poisoning in humans). S. choleraesuis (a cause of salmonellosis of malingitis), S. dublin (a cause of both a systemic and diarrhoea) (arcs contile, especially of new-born calves), Haemophilus influenzae (a cause of cause of cause of cause of cause of cause of meningitis). Nelsseria gonorrhoeae (a cause of gonorrhoeae), Yersinia from gastroenteritis to fatal septicaemic disease, in humans ranging from gastroenteritis to fatal septicaemic disease), Bordetella pertusais (the cause of whooping cough), and Brucella abortus (a cause of abortion humans).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel method for predicting the tendency of a protein to form either: (a) an amphiphilic alpha-structure or (b) an amphiphilic beta-structure. The methods are used particularly for predicting the structure of membrane proteins such as glucose transporter proteins (GLUTS). They can be used to discern the function of proteins. They can also be used for the rational design or identification of compounds which interact with the proteins or to engineer proteins having particular structures. This sequence represents an Escherichia coll Ompf porlin which is used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             240
